Mission: Serve the medical researchers, and through them physicians and patients

Approach: We develop

- ML methods for learning on streams of data for each patient
- ML methods for filling the gaps
- ML methods for the acquisition of labels, features and constraints
- Complete workflows and frameworks

In parallel, we work on experimental data:

- experiments and studies on human behaviour [analy
- experiments on crowdworking

[analysis] [our own designs]

Our projects and our inspiring partners

Ongoing Projects:

- ImmunLearning (2019 2022): EFRE project on a diagnostic test for immunocompetence for elderly people (with U Med OVGU)
- CHRODIS+ (2017-2020) EU Joint Action on "Implementing good practices for chronic diseases"
- * UNITI (2020-2022) EU project on "Unification of Treatments and Interventions for Tinnitus Patients"

Further cooperations in medical research:

- · Learning on longitudinal epidemiological data (U Med Greifswald)
- · Intelligent wearables for patients with diabetic foot (U Med Magdeburg)
- · Phenotyping, patient evolution clinic & m/eHealth (U Med Regensburg)
- · Phenotyping and patient response to treatment (CHARITE)

This is Part III of Tutorial 8:

- Structure of clinical data; prediction methods; open challenges
- Structure of mobile, dynamic data; prediction methods; open challenges

RECALL: The CRISP-DM Circle

[Chapman et al., 2000]

²downloaded at Nov 26, 2020

Chronic Disorders / Diseases / Conditions

Example 2: Tinnitus

Tinnitus as subject of research

Rationale

Although much progress has been made, tinnitus remains a scientific and clinical enigma of high prevalence and high economic burden.

A large variety of patient characteristics - including genotyping, aetiology, and phenotyping - are poorly understood, because **integrated systems approaches are still missing** to correlate patient's characteristics to predict responses to combinatorial therapies.

This project has received funding from European Union's Horizon 2020 Research and Innovation Programme under Grant Agreement No°848261.

⁵H2020 project UNITI 'Unification of Treatments and Interventions for Tinnitus Patients', since Jan 1, 2020

Medical Data

Example: The Tinnitus Case History Questionnaire ⁶ cf. [Langguth et al., 2007]

"Items list" for tinnitus case history questionnaires

Items are ordered according to their level of significance: Category "A" (= essential) in bold type.

Background

- 1. Age.
- 2. Gender.
- Handedness.
- 4. Family history of tinnitus (parent, sibling, children).

Tinnitus history

- 5. Initial onset. Time?
- 6. Initial onset. Mode? Gradual or abrupt?
- Initial onset. Associated events? Hearing change, Acoustic trauma, Otitis media, Head trauma, Whiplash, Dental Treatment, Stress, Other.
- 8. Pattern. Steady? Pulsatile? Other?
- 9. Site. Right ear? Left ear? Both ears? (symmetrical?) Inside head?
- 10. Intermittent or constant?
- 11. fluctuant or non-fluctuant?
- 12. Loudness. Scale 1-100. At worst & at best?
- 13. Quality. Own words / Give a list of choices.
- 14. Pure tone or Noise? Uncertain / polyphonic?
- 15. Pitch. Very high? High? Medium? Low?
- 16. Percentage of awake time aware of tinnitus?
- 17. Percentage of awake time annoyed by tinnitus?
- 18. Previous tinnitus treatments (no, some, many)?
- Modifying influences
 - 19. Natural masking? Music, everyday sounds, other sounds?
 - 20. Aggravated by loud noise?
 - 21. Altered by head and neck movement or touching of head or upper limbs (specification of the respective movements)?
 - 22. Daytime nap. Worse? Better? No effect?
 - 23. Effect of nocturnal sleep on daytime tinnitus?
 - 24. Effect of stress?
 - 25. Effect of medications? Which?
- Related conditions
 - 26. Hearing impairment?
 - 27. Hearing aids (No, left ear, right ear, both ears; effect on tinnitus)?
 - 28. Noise annoyance or intolerance?
 - 29. Noise induced pain?
 - 30. Headaches?
 - 31. Vertigo/dizziness?
 - 32. Temporomandibular disorder?
 - 33. Neck pain?
 - 34. Other pain syndromes?
 - 35. Under treatment for psychiatric problems?

As an example of how the above items can be expressed for patients to complete see the

Model learning on T0 to predict T1 for target TQ_score $\in \{0, 1\}$

11 algorithms: LASSO, RIDGE, Generalized Partial Least Squares (GPLS), SVM, a feedforward NN with one hidden layer, weighted kNN, NB, CART, C5.0, RF, Gradient Boosted Trees (GBT) hyperparam selection: grid search k=10 folds: 10-fold stratified cross validation

AUC: as performance measure

Feature filtering and scoring

Model reliance [Fisher et al., 2018]: of feature f as "classification error on the original training set [vs] classification error on a modified version of the training set where the values of f are randomly permuted."

SHAP value [Lundberg and Lee, 2017] of feature f for instance x "as change in the expected value of the prediction if for f the feature vector of x is observed instead of [a] random [one]"

Prediction and Minimization of the Feature Space

[Niemann et al., 2020b]

⁸Figure 6 from [Niemann et al., 2020b]: (A) features sorted on importance, and achieved AUC of a feature and its predecessors; (B) graph of correlations (for absolute values of 0.5 and higher)

Joint Action (09/17-11/20) funded by the EU and participating organisations

GOAL: Contribute to reducing the burden of chronic diseases by promoting the implementation of policies and practices that have been demonstrated to be successful. The development and sharing of these tested policies and projects across EU countries is the core idea behind this action.

WP7: Fostering the quality of care for people with chronic diseases:

through the implementation of a set of quality criteria and recommendations defined in the previous JA CHRODIS.

Task 3 on mHealth tools: three pilot studies on self-empowerment of patients with help of mobile technology:

- · Cantabrian Health Service CSC in Spain
- · National Center of Public Health and Analyses NCPHA in Bulgaria
- · University Hospital Regensburg UHREG in Germany

T7.3: NPCHA pilot on diabetes \longrightarrow [Unnikrishnan et al., 2020a]

T7.3: UHREG pilot TinnitusTips on tinnitus [Unnikrishnan et al., 2020b]

Questionnaire - many times a day

ID	Item description and value	range
s01	Did you perceive the tinnitus right now?	Y/N
s02	How loud is your tinnitus right now?	0100
s03	How distressed are you by your tinnitus right now?	0100
s04	How well do you hear right now?	0100
s05	How much are you limited by your hearing right now?	0100
s06	How stressed do you feel right now?	0100
s07	How exhausted do you feel right now?	0100
s08	Are you wearing a hearing aid right now?	Y/N

Groups of participants: Y, A, B

Groups Y and A received non-personalized tips from the beginning; group B received the tips only from the middle of the study onwards.

Huge potential for

- * patient empowerment
- * assistance towards caregivers
- * better diagnostics
- * deeper insights to chronic diseases

The dilemma of time series length:

- · long time series: useful for phenotyping and prediction
- · short time series: little to learn on, very little to predict

Some solutions:

- entity-centric methods that prevent building a global model mainly on the data of very few users
- $\cdot\,$ methods for learning and predicting despite the gaps
- $\cdot\,$ methods for the identification of influence factors
